PROFILE

Java backend developer with an MSc in Software Development and hands-on experience from an industry internship and three self-built projects. I build and test Spring Boot services, design relational databases, and validate behaviour with Postman, JUnit, and integration checks before handover.

I focus on why a system is built a certain way, not only how, and I stay calm and reliable when requirements, integrations, or deadlines shift.

What I bring

- **Backend Delivery from real workflows:** I built practical experience building **Spring Boot** backend features, including service logic, API endpoints and database access during internship and project work, and I take a feature from a user scenario to working Spring Boot service logic.
- **API Integration and Interface Support:** Experience checking request parameters, response fields and interface behaviour while coordinating backend changes with frontend developers.
- **Testing and Validation:** I built experience through internship and university works by validating with **Postman, JUnit, integration checks, and pre-release user testing** before handover. When I use AI coding tools, I treat the output as a draft, I run the project by myself and check edge cases instead of blindly accepting the code.
- **Database design and SQL:** I **design MySQL tables** around real workflow so the data stays consistent and traceable as features grow.
- **Agile Teamwork:** I keep group delivery moving by clarifying task ownership, priorities early, especially in deadline-driven university and internship settings.

PROJECTS

- **JavaInsight Code Quality Analysis Tool (dissertation):**
Java, Maven, JUnit
 - A Java based static analysis tool that scans Java source projects and detects duplicated logic, sensitive keywords, and unused variables, then converts findings into an explainable 0 to 100 quality score with charts and PDF export.
- **JobApplicationTracker:**
Java, Spring Boot, Docker, PostgreSQL, MinIO
 - A Spring Boot web app to manage job applications, statuses, notes and role-specific documents in one workflow, using PostgreSQL for structured records and MinIO for uploaded CVs and cover letters.
- **Personal Portfolio Website:**
HTML, CSS, JavaScript, JSON, Vercel
 - A static portfolio website that presents project demos, GitHub links, and technical experience through a structured JSON project data model, deployed on Vercel with a custom domain.

WORK EXPERIENCE

Software Engineer Intern, [China Telecom Corporation Limited, China](#)

July 2023 – August 2024

- Client Service Platform

- Supported Spring Boot service logic and backend endpoints for an internal platform, and adjusted behaviour based on feedback from integration testing with the frontend team.
- Wrapped an external communication API (XSwitch) behind the platform's own backend methods so internal business modules could call it through a single, controlled interface.
- Used Postman to check request payloads, response fields, status codes and error cases before handing changes to frontend developers.

- AI Model Marketplace, Add to Cart Module

- Built the add to cart backend for an internal AI model marketplace, covering cart creation, item selection and checkout status.
- Designed the MySQL tables for carts, cart items, products and status fields by working through how a user would add, update and check out items.
- Tested insert and update behaviour with simulated requests to confirm user, product and cart records stayed linked correctly.

- Agricultural Traceability Platform

- Investigated and fixed frontend errors caused by backend API changes, using the browser console and Postman to trace each problem back to its source.
- Tested user flows from an end user point of view and reported reliability issues before release.
- Built two login pages with basic input validation and adjusted them based on test feedback.

Other Experience

Trading Assistant, Sainsbury's, UK

October 2025 – Present

- Handled fast-paced tasks while judging priorities during busy periods.
- Collaborated with colleagues to maintain efficient operations and respond quickly to changing demands.

EDUCATION

MSc: Software Development (With Merit)

September 2024 - December 2025

University of Glasgow - Glasgow, UK

- **Modules Included:** Advanced Programming, Algorithms and Data Structures, Secure Software Engineering, Database
- **Team collaboration:** Led sprint-based coursework teams by organising weekly meetings, clarifying task ownership and tracking progress toward project deadlines.

TECHNICAL SKILLS

- **Languages and Frameworks:** Java, Spring Boot, REST APIs, SQL
- **Databases and Storage:** MySQL, PostgreSQL
- **Tools and Testing:** Git, Docker, Maven, JUnit, Postman, Vercel
